  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

LOCALIZED ON THE BASOLATERAL SURFACE OF THE ENTEROCYTES.
TISSUE SPECIFICITY: WIDELY EXPRESSED. THE PROTEIN IS DETECTED DUODENUM AND JEJUNUM BUT NOT IN ILEUM AND COLON.
INDUCTION: SLIGHTLY BY ZINC IN THE INTESTINE, BUT NOT THE LIVE SIMILARITY: BELONGS TO THE SLC30A FAMILY OF TRANSPORTERS.
FUNCTION: CONTROLS PRONEURAL AND VEIN FORMING GENES. POST:
TRANSCRIPTIONAL CONTROLER OF AC-SC (ACHAETE-SCUTE). MAX AX
ACTIVATOR THAT INTERACTS WITH THE TRANSCRIPTIONAL COMPLEX
ASSEMBLED ON THE AC AND SC PROMOTERS AND PARTICIPATES IN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is derived from human high molecular weight kininogen (HK) domain 5. HK is a 120 kD glycoprotein which binds with high affinity to endothelial cells, where it is cleaved to two-chain high molecular weight kininogen (HKa) by plasma kallikrein. Hka or a synthetic compound comprising part or all of the present sequence may be used in a pharmaceutical composition for inhibiting angiogenesis. Angiogenesis occurs in a number of disease states, such as tumour formation and expansion, and certain ocular disorders. It can also occur in a rheumatoid joint, hastening joint destruction by allowing an influx of leukocytes. The composition may inhibit angiogenesis by inhibiting endothelial cell proliferation or by inducing endothelial peptides, natural peptides used in the composition may be recombinant of cell appotesis. Peptides used in the composition may be recombinant peptides, natural peptides, or synthetic peptides. They may also be methods using ynthesised, using, for example, solid phase synthesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                 The present sequence is derived from human high molecular weight kininogen (HK) domain 5. HK is a 120 kD glycoprotein which binds with high affinity to endothelial cells, where it is cleaved to two-chain high molecular weight kininogen (HKa) by plasma kallikrein. Hka or a synthetic compound comprising the present sequence may be used in a pharmaceutical composition for inhibiting anglogenesis. Anglogenesis occurs in a number of disease states, such as tumour formation and expansion, and certain occular disorders. It can also occur in a chamber of disease trates occurs in a number of disease states.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           or a synthetic compound comprising the present sequence may be used in a pharmaceutical composition for inhibiting anglogenesis. Angiogenesis occurs in a number of disease states, such as tumour formation and expansion, and certain ocular disorders. It can also occur in a rheumatoid joint, hastening joint destruction by allowing an influx of leukocytes. The composition may inhibit anglogenesis by inhibiting endothelial cell proliferation or by inducing endothelial cell proliferation or by inducing endothelial cell proliferation or by inducing endothelial cell proliferation may be recombinant peptides, natural peptides, or synthetic peptides. They may also be chemically synthesised, using, for example, solid phase synthesis methods.
rheumatoid joint, hastening joint destruction by allowing an influx of leukocytes. The composition may inhibit angiogenesis by inhibiting endothelial cell proliferation or by inducing endothelia
                                                                                                                                                                                                                                Claim 13; Page 29; 52pp; English.

                                                                                       high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.
